

# Subjective and Objective Measurement

Kai Römer

TU-München  
Department of Informatics  
Chair for Computer Aided Medical Procedures & Augmented Reality

30. April 2007

# Introduction

- ▶ different types of user interfaces
- ▶ need for empirically test these user interfaces
- ▶ ability to improve the quality of user interfaces

# Overview

⇒ need for measuring usability.

- ▶ What is usability?
- ▶ How do I measure usability for time-critical user interfaces ?
  - ▶ subjectively
  - ▶ objectively
- ▶ How do I evaluate results of measurement?

# What is usability?

- ▶ EN ISO 9241-11 European Standard for measuring usability
- ▶ a lot of prior art mainly based on ISO 9241-11

# Defining Usability

*The usability of a product is the degree to which specific users can achieve specific goals in a particular environment with effectiveness, efficiency and satisfaction. [1]*

- ▶ really common definition based on ISO 9241-11
- ▶ seems not to be really helpfull for time-critical 3D UIs
- ▶ not mentioning the main issues of time-critical 3D UIs
- ▶ so new : not yet standardise.

# Finding the Main Issues of Usability Testing

These problems should be in mind, when testing time-critical 3D UIs

- ▶ Information Overload (IO)
- ▶ Change Blindness (CB)
- ▶ Perceptual Tunneling (PT)
- ▶ Cognitive Capture (CC)

# Measuring Distraction

- ▶ time-critical → separation between main task and second task
- ▶ main task: driving, surgery, ...
- ▶ secondary task: using the interface
- ▶ interface may not disturb the main task!

Influence of usage of supportive interface on the main task needs to be measured.

# Overview

- ▶ Objective Measurements
- ▶ Subjective Measurements

# Objective Measurement

- ▶ task time
- ▶ eye tracking
- ▶ occlusion test
- ▶ quality of main task
- ▶ peripheral detection

# Task Time

- ▶ time for application of secondary task
- ▶ main method for tests
- ▶ results:
  - ▶  $t_{secondarytask}$
  - ▶ ratio:  $\frac{t_{secondarytask}}{t_{maintask}}$
- ▶ danger of distraction
- ▶ length of distraction

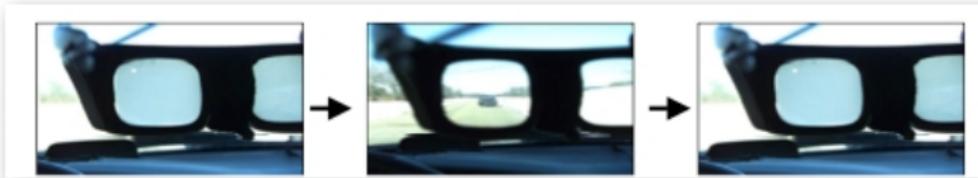

# Eye Tracking: Glance Off Time

- ▶ time to
  - ▶ focus on an instrument +
  - ▶ read an instrument +
  - ▶ focus back on the main task
- ▶ time to mentally process information not included
- ▶ out of the loop effect
- ▶ ratio between time used for main task and secondary task

# Occlusion Test

- ▶ measuring of time for secondary task
- ▶ main task neglected
- ▶ shutter glasses:
  - ▶ open for secondary task (1,5s)
  - ▶ closed for main task (about 4s)
- ▶ speed of perception, understanding, transcription
- ▶ interruptibility/resumability/time dependence
- ▶ problem: cheating by the test person

# Occlusion Test

# Quality of Main Task

- ▶ find distraction by measuring the quality of main task
- ▶ automotive
- ▶ track/speed keeping
- ▶ lane changing
- ▶ steering wheel reversal rate

# Track/Speed Keeping Ability

- ▶ usage of interfaces
- ▶ measured in simulators or real cars
- ▶ cameras, tracking devices (GPS)
- ▶ cognitive capture, perceptual tunneling

# Lane Change Task

- ▶ development by DaimlerChrysler
- ▶ car simulator
- ▶ road course with 3 lanes and indication, which lane to change to
- ▶ difference between driver's and reference trajectory
- ▶ parallel task execution
- ▶ testing stress and workload while performing additional tasks
- ▶ disadvantage: unrealistic, unnatural driving
- ▶ advantages: simple, quick, standardised

# Lane Change Task

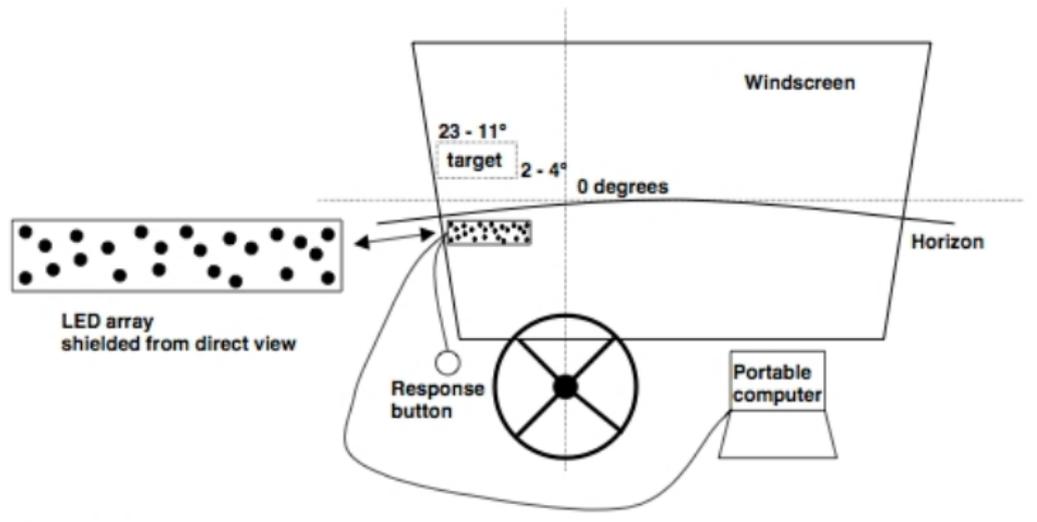

# steering wheel reversal rate

- ▶ rate of intense steering wheel corrections
- ▶ usually after looking at a instrument
- ▶ peak detection algorithm, counted
- ▶ workload

# Peripheral Detection Task

- ▶ extra task: respond to LED
- ▶ LEDs on horizontal line in different angles
- ▶ perceptual tunneling (errors)
- ▶ cognitive capture (reaction time)
- ▶ performance indices (workload) (average reaction time, errors)
- ▶ PDT is a concept, not a standardised test

# Peripheral Detection Task

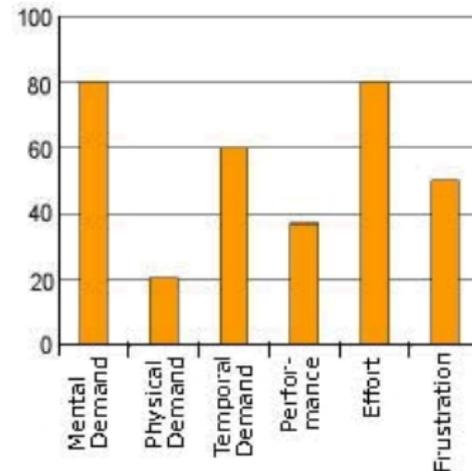

# Subjective Measurements

- ▶ subjective measurement means asking the users
- ▶ several given questionnaires
- ▶ most common: NASA-TLX, SWAT

# Different Questionnaires

- ▶ NASA-TLX: NASA Task Load Index
  - ▶ mental demand
  - ▶ physical demand
  - ▶ temporal demand
  - ▶ performance
  - ▶ effort level
  - ▶ frustration level

# Subjective Measurement

- ▶ SWAT: Subjective Workload Assessment Techniques
  - ▶ loads for time
  - ▶ mental effort
  - ▶ psychological stress

# Questionnaire

- ▶ Questionnaire is answered directly after the test.
- ▶ advantages
  - ▶ ease of implementation
  - ▶ low cost
  - ▶ limited intrusion on task performance
- ▶ disadvantages: lack of precision due to repetition, understanding
- ▶ information overload

# Cognitive Walkthrough

- ▶ test user tells what he is doing/feeling
- ▶ work flow test
- ▶ thought flow

# Evaluation of Test Results

Introduction

What is Usability?

Measuring Usability

Evaluating results of measuring usability

Conclusion

# What does a Test look like?

- ▶ group of representative participants
- ▶ define structure of tests
- ▶ order of tests and participants
  - ▶ within subject
  - ▶ between subject
- ▶ what values should be measured
- ▶ evaluate the results

# Goals

- ▶ Many numbers  $\longrightarrow$  few numbers
- ▶ Measures of central tendency:
  - ▶ Mean: average
  - ▶ Median: middle data value
  - ▶ Mode most common data value
- ▶ Measures of variability / dispersion

# Descriptive Statistics

- ▶ Mean:

$$\bar{X} = \frac{\sum X}{N}$$

- ▶ Mean absolute deviation:

$$\frac{\sum |X - \bar{X}|}{N} = MS$$

# Descriptive Statistics

- ▶ Variance:

$$s^2 = \frac{\sum(X - \bar{X})^2}{N - 1}$$

- ▶ Standard deviation:

$$s = \sqrt{\frac{\sum(X - \bar{X})^2}{N - 1}}$$

# Hypothesis Testing

Goal: conclude characteristics from samples

- ▶ Is system A significantly better than System B?
- ▶ Is there any significant difference anyway?

# Testing Hypotheses

1. hypothesis
2. develop testable hypothesis  $H_1$
3. develop null hypothesis (logical opposite)  $H_0$
4. calculate:

$$H_0 : p(X|H_0)$$

5. proves: Probability of logical opposite is small!
6. common significance levels are:  $\alpha \leq 0.05$ ;  $\alpha \leq 0.01$

# Methodes

- ▶ two variances: t-test
- ▶ several variances ANOVA

# t-Test

The t-test tells us, if the variation between two groups is “significant,,.

- ▶ 2 pairs, t-distribution
- ▶ implemented in e.g. Excel, SPSS
- ▶  $n_1, n_2$ : sample count
- ▶  $\bar{y}_1, \bar{y}_2$ : mean value
- ▶  $s$ : mean variance
- ▶ compare to value table of distribution

$$t = \frac{1}{\sqrt{\frac{1}{n_1} + \frac{1}{n_2}}} * \frac{\bar{y}_1 - \bar{y}_2}{s}$$

# ANOVA

- ▶ analysis of variance
- ▶ 2 or more groups
- ▶ f-distribution

$$F = \frac{n_1 n_2 (\bar{x}_1 - \bar{x}_2)^2}{(n_1 + n_2) \text{var}_g}$$

# Summary

- ▶ introduced several surveys of testing 3D UIs in time-critical environments
- ▶ presented, how tests can deliver reliable results
- ▶ showed ways of processing gathered data

Thank you for your attention!

NPL Report DICT 163/90: A preliminary design for a methodology for experimentally measuring usability, R E Renger, 1990

# Distraction from main Task

- ▶ main issue: distraction from main task.
- ▶ information overload (IO)
  - ▶ too much information
  - ▶ large amount of information
  - ▶ high rate of new information
  - ▶ contradictions in available information
  - ▶ low signal to noise ratio
  - ▶ problem to remain informed
  - ▶ problem to make a decision

# Distraction from main Task

- ▶ perceptual tunneling (PT)
  - ▶ focusing on one stimulus like flashing signal
  - ▶ leading to neglect of main task
- ▶ cognitive capture (CC)
  - ▶ lost in thought
  - ▶ caused by e.g. instruments requiring highly cognitive involvement
  - ▶ leads to a loss of situational awareness

# Situation Awareness

clear understanding of:

- ▶ what is going on in the environment
- ▶ what is going to happen in the nearest future
