Technik MSBT**

Overall Idea

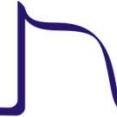

Max Schaldach -
Stiftungsprofessur

Biomedizinische
Technik **MSBT**

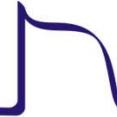

Agenda: Circulation Physiology

- **Circulation Physiology**
- **Heart Physiology**
- **Pathophysiology**
- **Therapy**

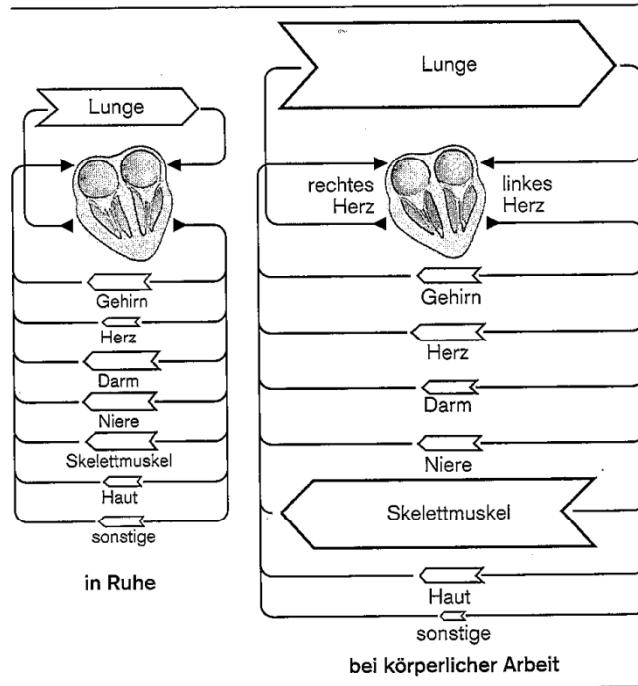

Agenda: Circulation Physiology

- **Circulation Physiology**
- **Heart Physiology**
- **Pathophysiology**
- **Therapy**

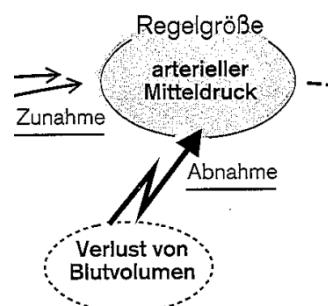

Circulation Physiology: Overview

- **Tasks and components:**

- Supply and disposal
- Pumping organ: the heart
- Systemic circulation (body)
- Pulmonary circulation (lung)
- Coupled to breathing
- Central vessels
- Peripheric vessels

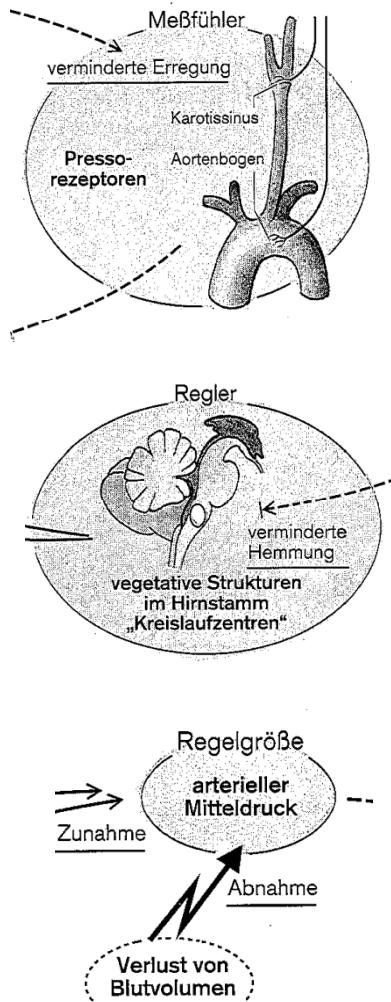

Klinke/Silbernagel (1994)

- **Regulation cycle (Homeodynamic):**

- Sensors for detection of information
- Neural means of processing (ZNS, ANS)
- Different actuators and relevant variables

Circulation Physiology: Sensors

Klinke/Silbernagel (1994)

- **Baroreceptor Reflex:**

- sinus carotis, arcus aortae
- PD regulation properties
- Disorders: neuropathy, sclerosis

- **Chemoreceptors:**

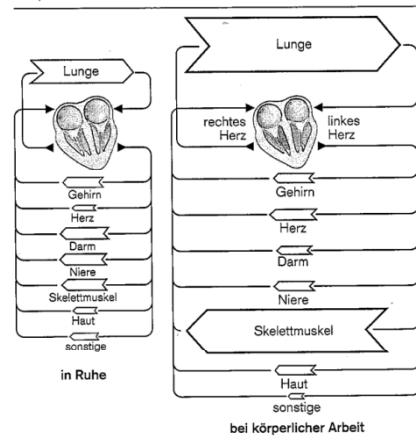

- Partial pressures, pH value
- Coupling heart rate and breath

- **Local Regulation:**

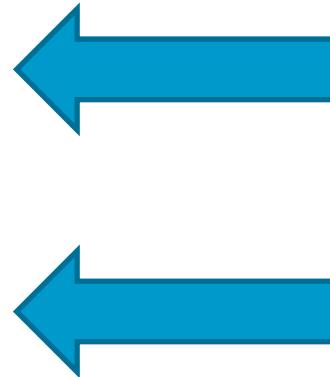

- Afferent heart nerves, thoracic pressure
- Frank-Starling law
- Cellular receptors (peripheral, heart)

Circulation Physiology: Efferent Nerves and Actuators

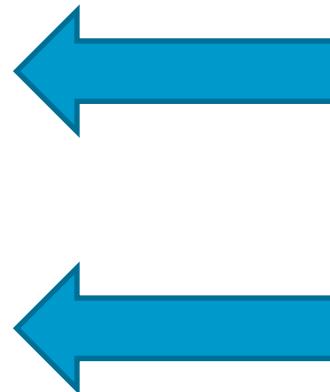

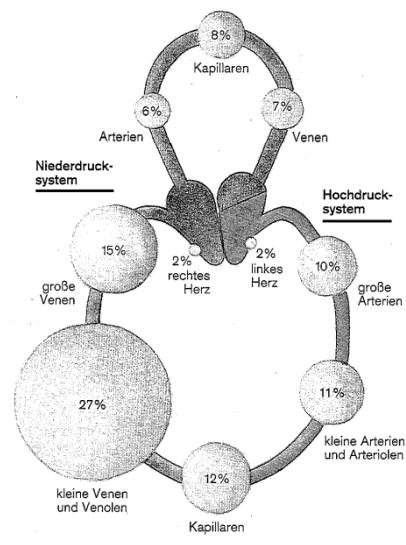

Klinke/Silbernagel (1994)

Heart Rate

Contractility

Antagonistic interaction of n. vagus and n. sympathicus

Vascular Resistance

Catecholamines etc.

Circulation Physiology: Standard Values (Hausbeck 2006)

Normalwerte	
Herzrate in Ruhe ¹	50–100 1/min
Herzrate eines Neugeborenen	140 1/min
Herzrate eines 10-jährigen Kindes	90 1/min
Herzrate eines Erwachsenen	60–70 1/min
Schlagvolumen in Ruhe	70 ml
Schlagvolumen unter Belastung	bis 130 ml
Herzminutenvolumen in Ruhe ²	4,9 l/min
Herzminutenvolumen unter Belastung	bis 25 l/min

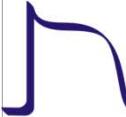

Druck im Gefäß		Mittelwert
Aorta		105 mmHg
Kapillaren (arteriennah)		32–37 mmHg
Kapillaren (venennah)		16–21 mmHg
Venen		bis 10 mmHg
reiner Fülldruck aller Gefäße bei Herzstillstand		6–7 mmHg

Druck bei Herzaktion		systolisch	diastolisch
linker Ventrikel		90–130 mmHg	2–8 mmHg
rechter Ventrikel		20–30 mmHg	0–4 mmHg
linkes Atrium		8–15 mmHg	5–9 mmHg
rechtes Atrium		1–5 mmHg	0–2 mmHg
Aorta		90–130 mmHg	60–90 mmHg
Arteria pulmonaris		20–30 mmHg	8–12 mmHg

Volumen		systolisch	diastolisch
Ventrikel in Ruhe		140 ml	60–70 ml
Ventrikel unter Belastung		200–300 ml	10–30 ml
Atrium in Ruhe		11 ml	5 ml

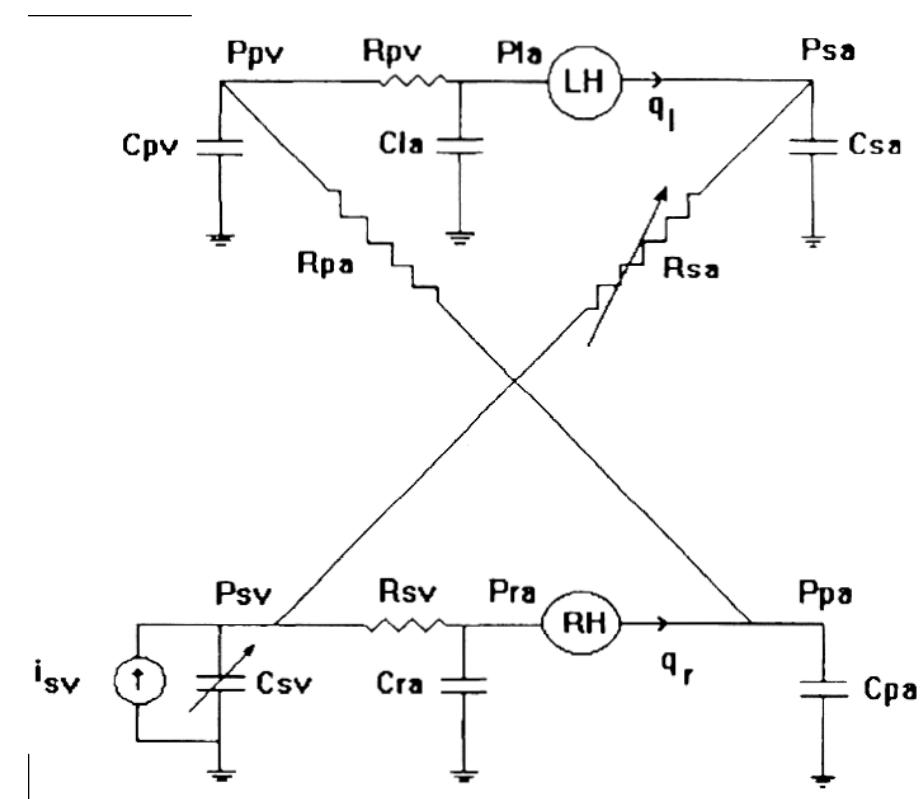

Alter	17–25	26–35	36–45	46–55	>55

Analysis: Mean Heartrate and Spontaneous Fluctuations

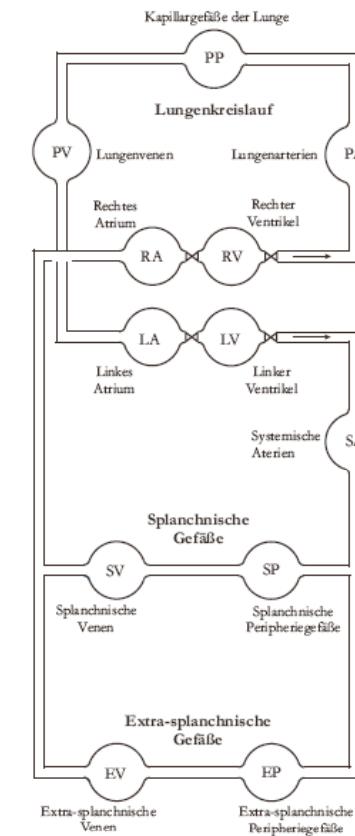

Modelling of Circulation

Equivalent Circuit

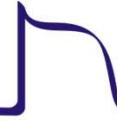

Ursino (1998)

Windkessel Model

Ursino (1995)

Description and analysis by **nonlinear coupled** differential equations

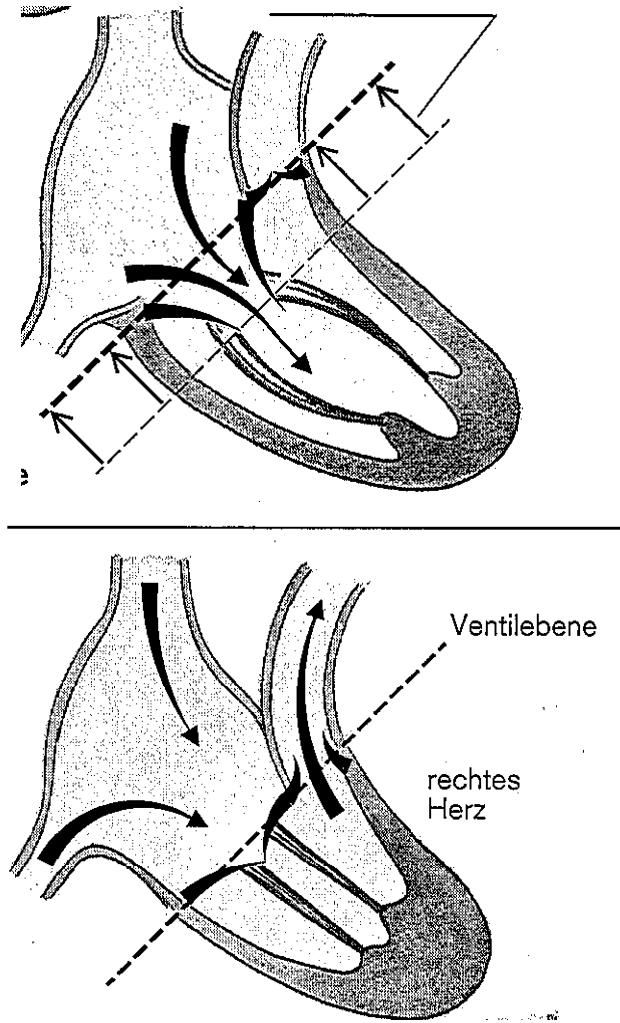

Agenda: Circulation Physiology

- **Circulation Physiology**
- **Heart Physiology**
- **Pathophysiology**
- **Therapy**

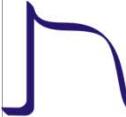

Heart Physiology: Basics of Anatomy

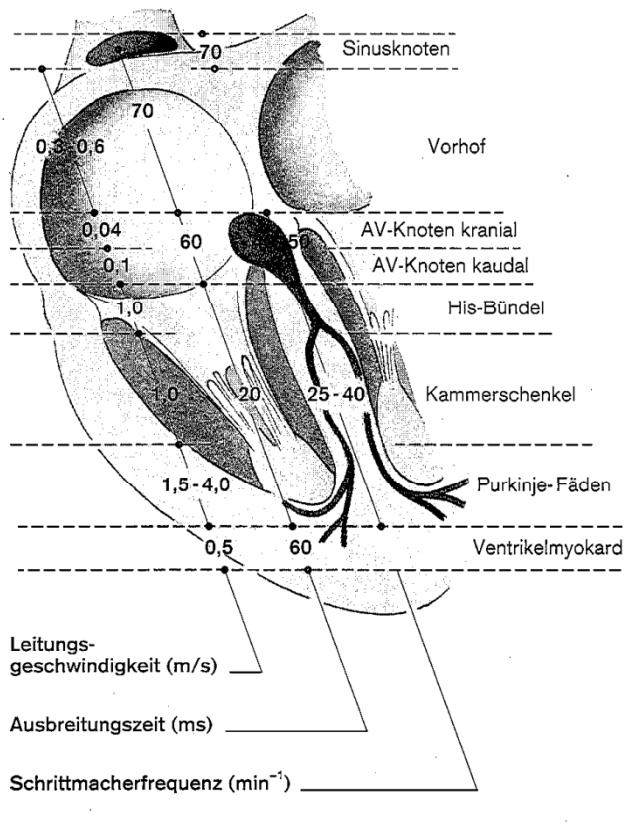

Klinke/Silbernagel (1994)

- **Diastole (Relaxation):**
 - Atrial filling
 - Sinus node: origin of excitation
 - Beginning of atrial contraction
 - Opening of AV valves
- **Systole (Contraction)**
 - Ventricular filling continues
 - Closure of AV valves
 - Opening of aortic valve
 - Ejection of blood volume
- **Disorders:**
 - Improper valve function
 - Lack of contractile force
 - Missing chamber coordination
 - Excitation disturbances

Heart Physiology: Origin and Spread of Excitation

Physiological Sequence of Excitation

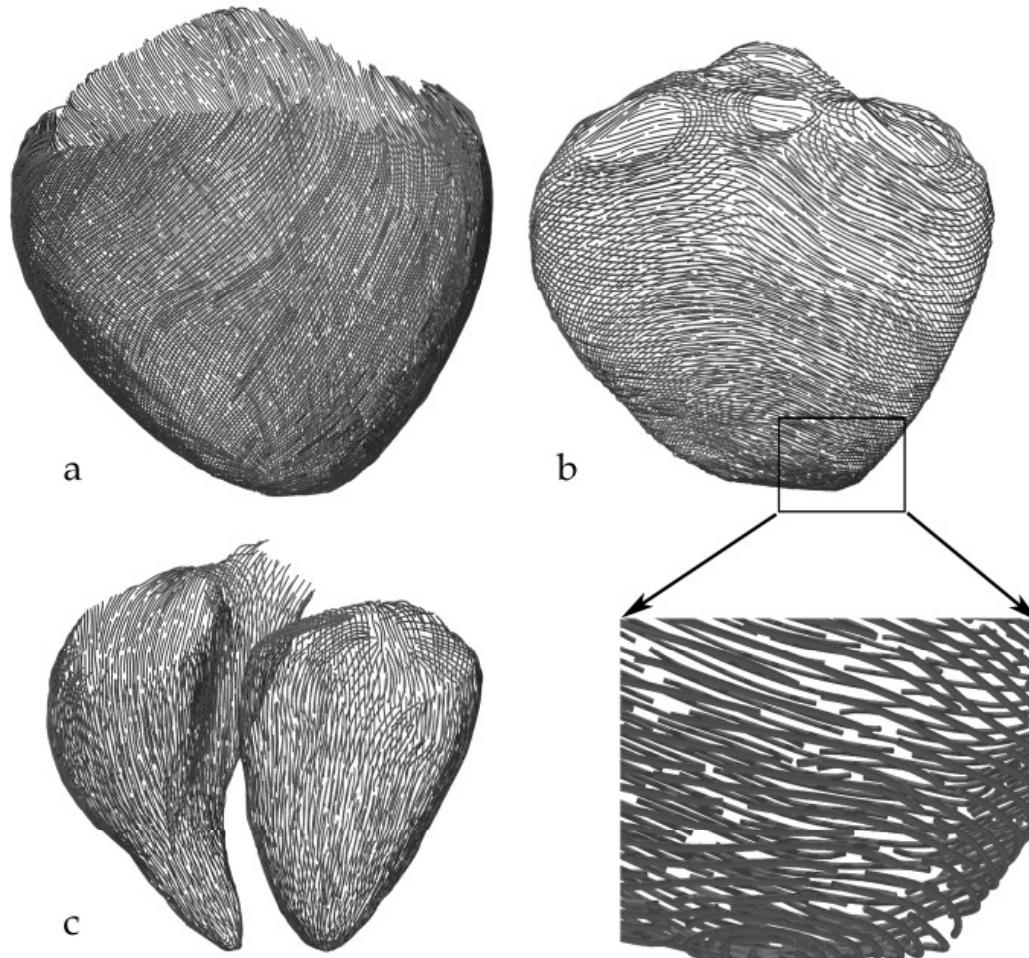

Klinke/Silbernagel (1994)

- **Sinus Node:**
 - Proper origin of excitation
- **AV Node:**
 - Delayed spread to chambers
- **Tawara branches und Purkinje fibers:**
 - Homogeneous spread in myocardium
- **Relevant Disorders:**
 - Pulmonary vein activity
 - Reentry tachycardia (valve level)
 - Atrial and ventricular fibrillation
 - Ectopic foci, premature excitation
 - Block of excitation spread

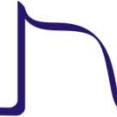

Model of the Heart: Mechanical aspects of Contraction

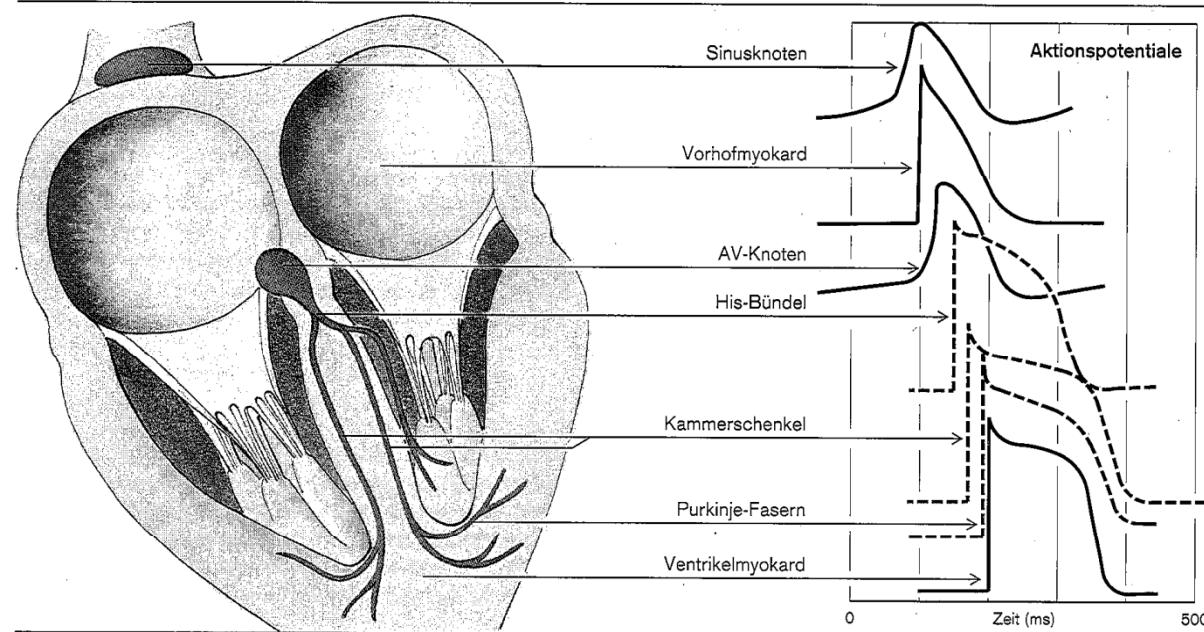

Lippert (2010)

- **Objective:**
 - Model geometric conditions
 - Modelling of electrical phenomena
- **Remarks:**
 - Finite elements
 - Design of anatomical fiber structure
 - Complex dynamics of contraction

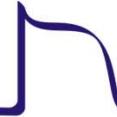

Heart Physiology: Cellular Level

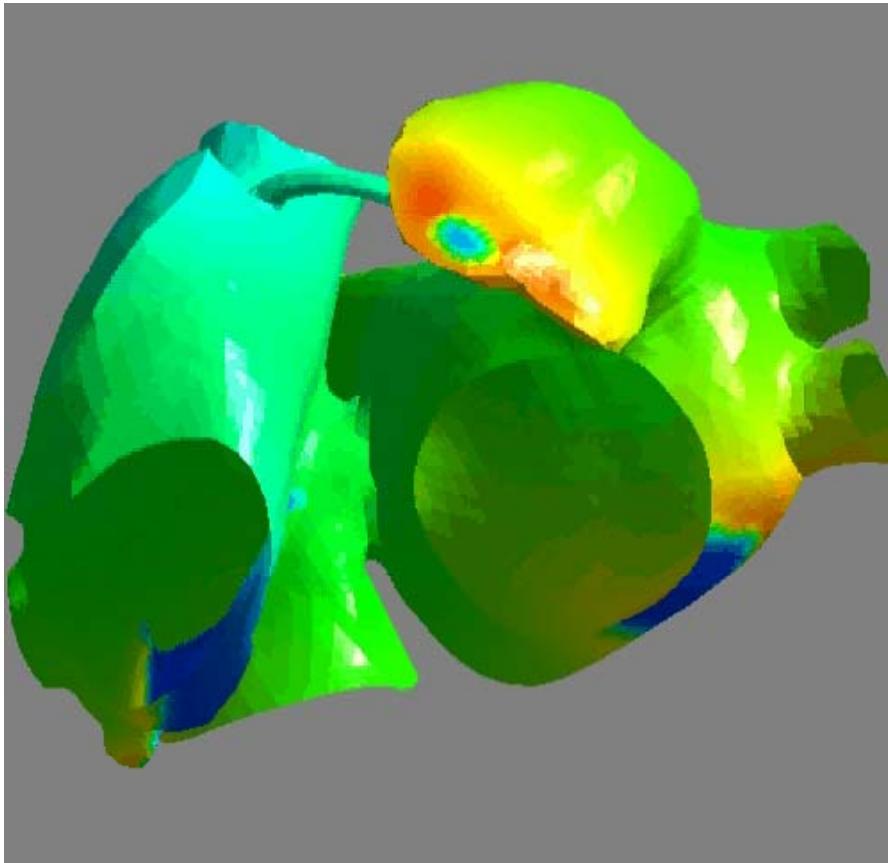

Klinke/Silbernagel (1994)

- **Action Potential** of cardiac cells:
 - Depends on functionality
 - Determines contractility (calcium)
 - Action (and rest) potential determined by ion channels
 - Parameters: voltage, refractory period, coupling

Modelling the Heart: Cell and Tissue Models

Pathological Excitation Spread

Krätschmer (2002)

- **Objective:**
 - Modelling of rhythm disturbances
 - Identification of possible therapeutic approaches
- **Models:**
 - Cell specific
 - Hodgkin-Huxley (ion ch.)
 - Nygren (atrium)
 - Luo-Rudy (ventricle)
 - Anatomic modelling necessary

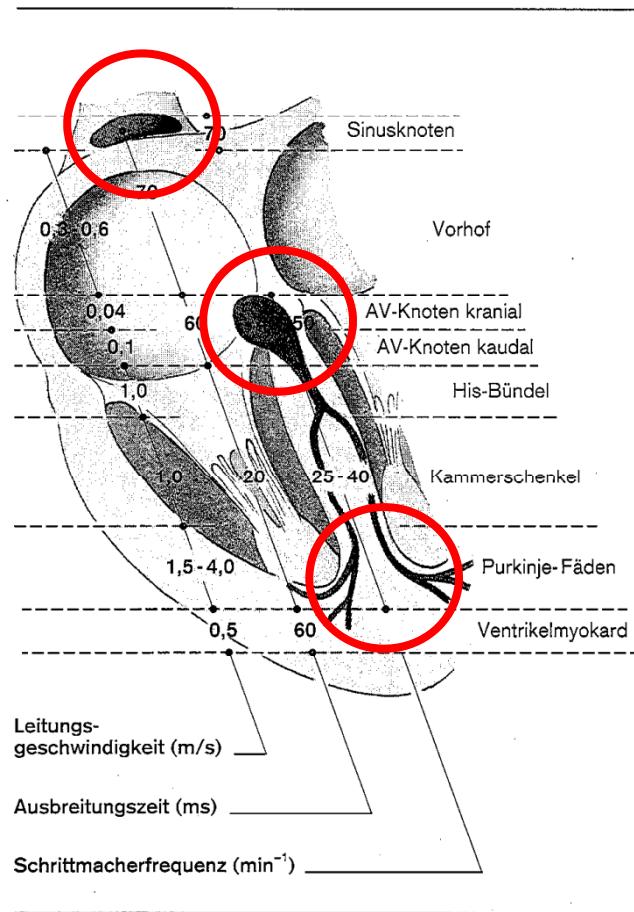

Agenda: Circulation Physiology

- **Circulation Physiology**
- **Heart Physiology**
- **Pathophysiology**
- **Therapy**

Bradycardia: Disturbances of Excitation Generation and Spread

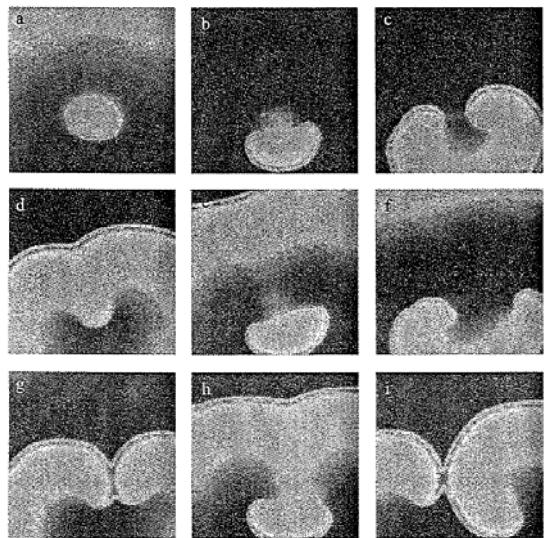

Klinke/Silbernagel (1994)

- Disturbance of **sinus node**:
 - Slow substitute rhythm
 - Irregularities
- **AV block** of different grade:
 - Dissociation atrium/ventricle
 - Tachyarrhythmia
- **Bundle Branch block**:
 - Dissociation of ventricles
 - May result in heart failure

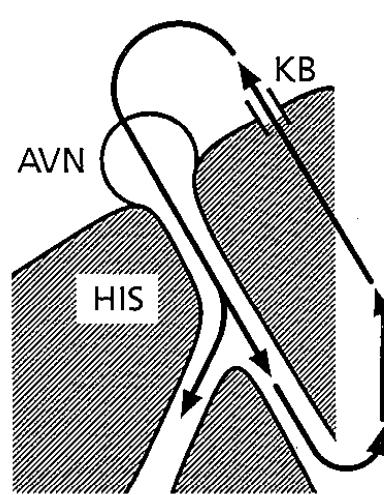

Tachyarrhythmia in Atria and Ventricles

Krätschmer (2002)

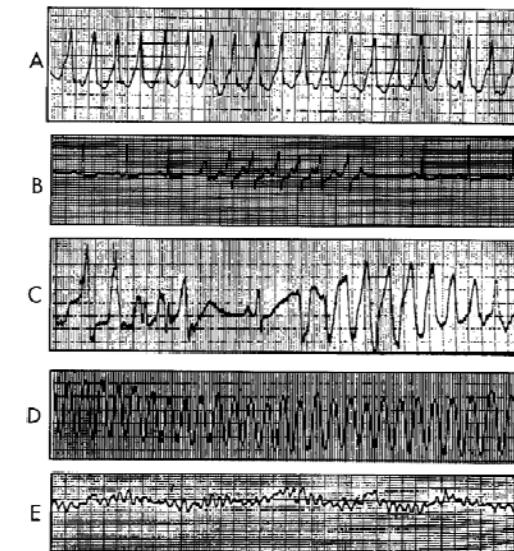

Atrial Fibrillation

- **Factors:**
 - Arrhythmogenic heart muscle (cellular disturbances)
 - Anatomical abnormalities (block, pathways)
 - Triggers: premature beats

Kalusche (1996)

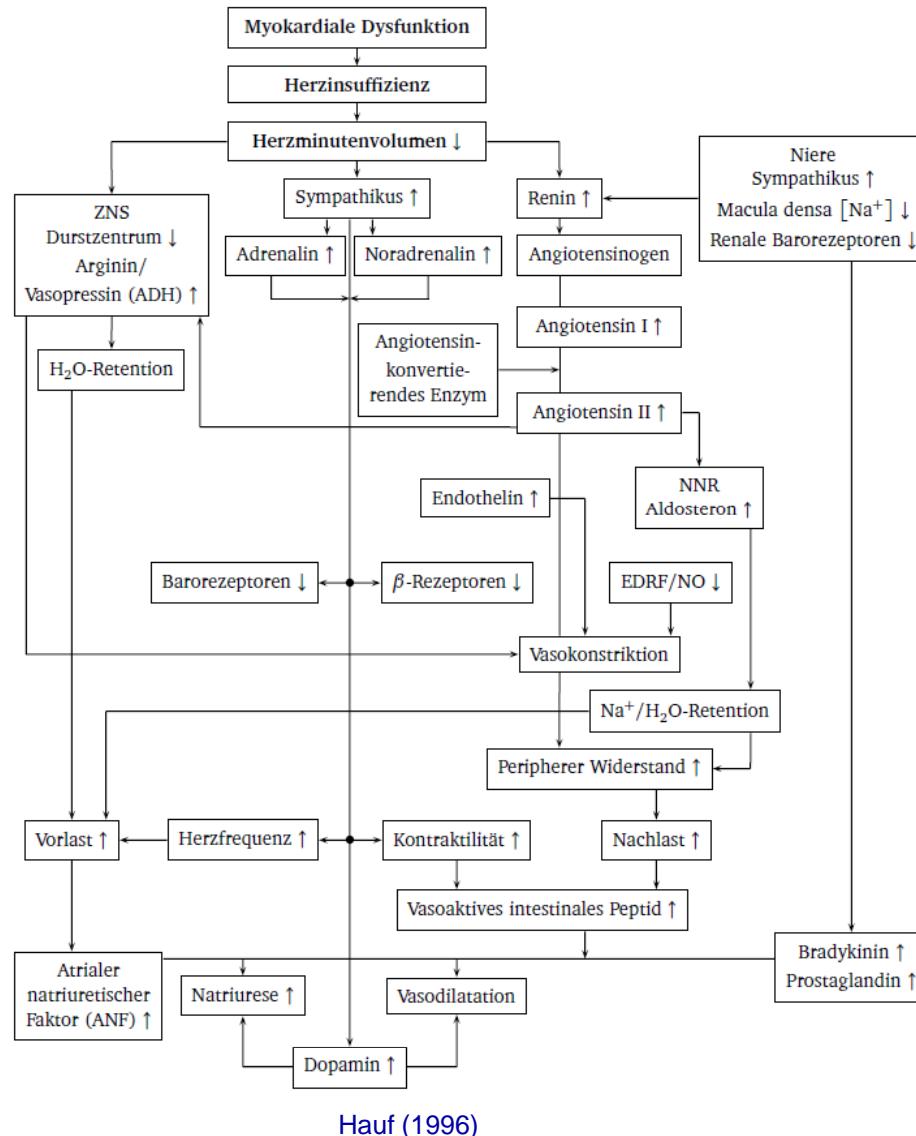

AV Reentry

Miller (1991)

Sudden Cardiac Death

Heart Failure: A Vicious Circle

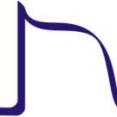

- Characteristics:**

- Progressive pump failure
- Multiple factors, complex regulatory mechanisms
- Can be “compensated” for a while
- Death by “decompensation”

- Consequences:**

- High morbidity and mortality
- Results in extremely high costs for health system
- Demand for regular monitoring

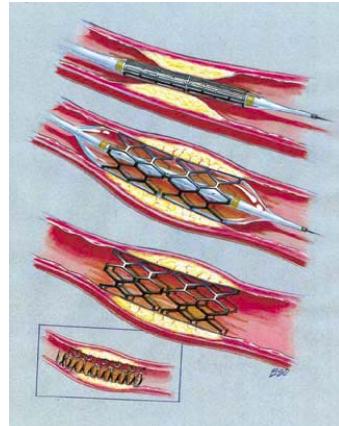

Agenda: Circulation Physiology

- **Circulation Physiology**
- **Heart Physiology**
- **Pathophysiology**
- **Therapy**

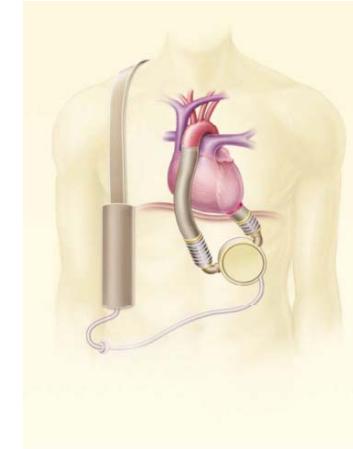

Surgical Therapies: Revascularisation etc.

Roberts (2010)

Feldmann (2005)

Goldstein (1998)

- **Types of surgical procedures:**
 - Elektrophysiological testing, HF ablation
 - Valve substitution, vessel surgery, cardiomyoplasty
 - Cardiac transplantation (including remote monitoring)
 - Cardiac assist devices (temporarily, permanently)

Medication Therapy: Types of Relevant Drugs

- **β Blockers:**
 - Decrease of adrenergic activation
- **ACE Blockers, Diuretics:**
 - Maintenance of fluid status
- **Antiarrhythmics:**
 - Influence on myocardial status

Topics of analysis e. g.: Monitoring of medication („patient compliance“)

Elektrotherapy of the Heart: Cardiac Rhythm Management

Slow Heart Rhythm:
Bradyarrhythmia

Artificial Pacemaker

Fast Heart Rhythm:
Tachyarrhythmia

Implantable
Defibrillator

Heart Failure:
Ventricular Dissociation

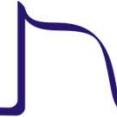

Cardiac
Resynchronization
Therapy

Several Diseases
Progression

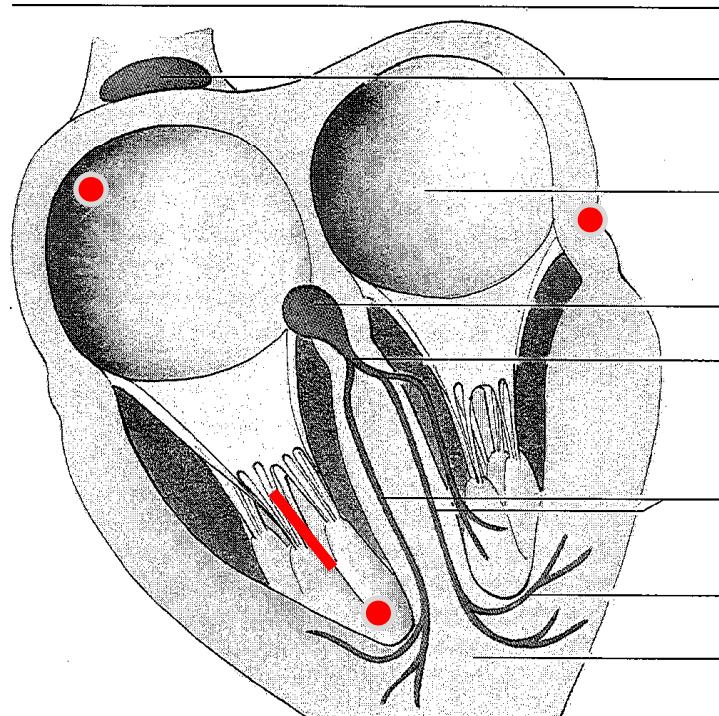

Remote Monitoring

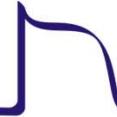

Example: Modern Electrotherapy

Three Chamber Defibrillator with Remote Monitoring

Klinke/Silbernagel (1994)

- Measurement of iEGM
- Includes activity sensor
- Stimulation impedance
- Cardiac resynchronization
- Defibrillation (ventricles!/?atria?)
- Thoracic impedance (feart failure)
- Remote monitoring
- Pacemaker for backup

Scope and Consequences of Heart Disease

- **Prevalence of Heart Disease:**
 - Atrial Fibrillation 1%-10%, growing with age, many comorbidities
 - Sudden cardiac death: >100000 annual cases (Germany)
 - More than 10 mio. Europeans suffering from heart failure
- **Implant Statistics:**
 - 100000 surgeries due to pacemaker systems, CRT increasing (DHR 2008)
 - ~10000 ICD implantations (2006), poor statistics, increasing
 - Proportion of remote monitoring: 22% ICD and 7% pacemaker (2007)
- **Important Research Topics:**
 - Early detection of disease / risk stratification
 - Increase of scope of application of electrotherapy
 - Full use of modern technological achievements (remote monitoring)
