

4.6 Symmetry Breaking

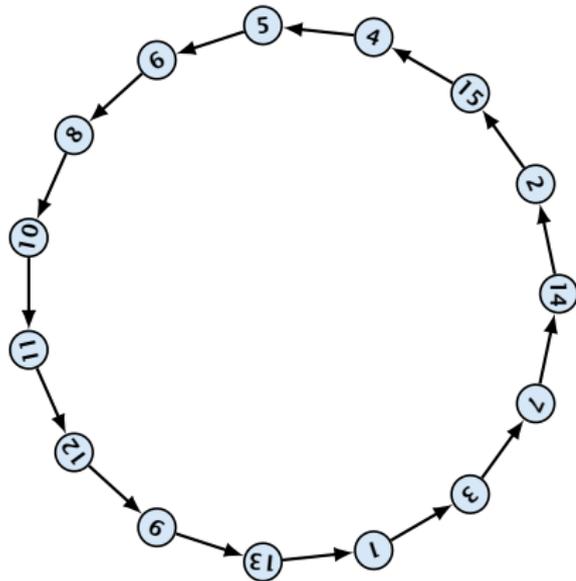

The following algorithm colors an n -node cycle with $\lceil \log n \rceil$ colors.

Algorithm 9 BasicColoring

- 1: **for** $1 \leq i \leq n$ **pardo**
- 2: $\text{col}(i) \leftarrow i$
- 3: $k_i \leftarrow$ smallest bitpos where $\text{col}(i)$ and $\text{col}(S(i))$ differ
- 4: $\text{col}'(i) \leftarrow 2k_i + \text{col}(i)_{k_i}$

(bit positions are numbered starting with 0)

4.6 Symmetry Breaking

v	col	k	col'
1	0001	1	2
3	0011	2	4
7	0111	0	1
14	1110	2	5
2	0010	0	0
15	1111	0	1
4	0100	0	0
5	0101	0	1
6	0110	1	3
8	1000	1	2
10	1010	0	0
11	1011	0	1
12	1100	0	0
9	1001	2	4
13	1101	2	5

4.6 Symmetry Breaking

Applying the algorithm to a coloring with bit-length t generates a coloring with largest color at most

$$2(t - 1) + 1$$

and bit-length at most

$$\lceil \log_2(2(t - 1) + 1) \rceil = \lceil \log_2(2t) \rceil = \lceil \log_2 t \rceil + 1$$

Applying the algorithm repeatedly generates a constant number of colors after $\mathcal{O}(\log^* n)$ operations.

4.6 Symmetry Breaking

Applying the algorithm to a coloring with bit-length t generates a coloring with largest color at most

$$2(t - 1) + 1$$

and bit-length at most

$$\lceil \log_2(2(t - 1) + 1) \rceil \leq \lceil \log_2(2t) \rceil = \lceil \log_2(t) \rceil + 1$$

Applying the algorithm repeatedly generates a constant number of colors after $\mathcal{O}(\log^* n)$ operations.

4.6 Symmetry Breaking

Applying the algorithm to a coloring with bit-length t generates a coloring with largest color at most

$$2(t - 1) + 1$$

and bit-length at most

$$\lceil \log_2(2(t - 1) + 1) \rceil \leq \lceil \log_2(2t) \rceil = \lceil \log_2(t) \rceil + 1$$

Applying the algorithm repeatedly generates a constant number of colors after $\mathcal{O}(\log^* n)$ operations.

4.6 Symmetry Breaking

Applying the algorithm to a coloring with bit-length t generates a coloring with largest color at most

$$2(t - 1) + 1$$

and bit-length at most

$$\lceil \log_2(2(t - 1) + 1) \rceil \leq \lceil \log_2(2t) \rceil = \lceil \log_2(t) \rceil + 1$$

Applying the algorithm repeatedly generates a constant number of colors after $\mathcal{O}(\log^* n)$ operations.

4.6 Symmetry Breaking

Applying the algorithm to a coloring with bit-length t generates a coloring with largest color at most

$$2(t - 1) + 1$$

and bit-length at most

$$\lceil \log_2(2(t - 1) + 1) \rceil \leq \lceil \log_2(2t) \rceil = \lceil \log_2(t) \rceil + 1$$

Applying the algorithm repeatedly generates a constant number of colors after $\mathcal{O}(\log^* n)$ operations.

4.6 Symmetry Breaking

As long as the bit-length $t \geq 4$ the bit-length decreases.

Applying the algorithm with bit-length 3 gives a coloring with colors in the range $0, \dots, 5 = 2t - 1$.

We can improve to a 3-coloring by successively re-coloring nodes from a color-class:

Algorithm 10 ReColor

```
1: for  $\ell \leftarrow 5$  to 3
2:   for  $1 \leq i \leq n$  pardo
3:     if  $\text{col}(i) = \ell$  then
4:        $\text{col}(i) \leftarrow \min\{\{0, 1, 2\} \setminus \{\text{col}(P[i]), \text{col}(S[i])\}\}$ 
```

This requires time $\mathcal{O}(1)$ and work $\mathcal{O}(n)$.

4.6 Symmetry Breaking

As long as the bit-length $t \geq 4$ the bit-length decreases.

Applying the algorithm with bit-length 3 gives a coloring with colors in the range $0, \dots, 5 = 2t - 1$.

We can improve to a 3-coloring by successively re-coloring nodes from a color-class:

Algorithm 10 ReColor

```
1: for  $\ell \leftarrow 5$  to 3
2:   for  $1 \leq i \leq n$  pardo
3:     if  $\text{col}(i) = \ell$  then
4:        $\text{col}(i) \leftarrow \min\{\{0, 1, 2\} \setminus \{\text{col}(P[i]), \text{col}(S[i])\}\}$ 
```

This requires time $\mathcal{O}(1)$ and work $\mathcal{O}(n)$.

4.6 Symmetry Breaking

As long as the bit-length $t \geq 4$ the bit-length decreases.

Applying the algorithm with bit-length 3 gives a coloring with colors in the range $0, \dots, 5 = 2t - 1$.

We can improve to a 3-coloring by successively re-coloring nodes from a color-class:

Algorithm 10 ReColor

```
1: for  $\ell \leftarrow 5$  to 3
2:   for  $1 \leq i \leq n$  pardo
3:     if  $\text{col}(i) = \ell$  then
4:        $\text{col}(i) \leftarrow \min\{\{0, 1, 2\} \setminus \{\text{col}(P[i]), \text{col}(S[i])\}\}$ 
```

This requires time $\mathcal{O}(1)$ and work $\mathcal{O}(n)$.

4.6 Symmetry Breaking

As long as the bit-length $t \geq 4$ the bit-length decreases.

Applying the algorithm with bit-length 3 gives a coloring with colors in the range $0, \dots, 5 = 2t - 1$.

We can improve to a 3-coloring by successively re-coloring nodes from a color-class:

4:        $\text{col}(i) \leftarrow \min\{\{0, 1, 2\} \setminus \{\text{col}(P[i]), \text{col}(S[i])\}\}$ 
```

This requires time $\mathcal{O}(1)$ and work $\mathcal{O}(n)$.

4.6 Symmetry Breaking

Lemma 7

We can color vertices in a ring with three colors in $\mathcal{O}(\log^ n)$ time and with $\mathcal{O}(n \log^* n)$ work.*

not work optimal

4.6 Symmetry Breaking

Lemma 8

Given n integers in the range $0, \dots, \mathcal{O}(\log n)$, there is an algorithm that sorts these numbers in $\mathcal{O}(\log n)$ time using a linear number of operations.

Proof: Exercise!

4.6 Symmetry Breaking

Algorithm 11 OptColor

```
1: for  $1 \leq i \leq n$  pardo
2:    $\text{col}(i) \leftarrow i$ 
3:   apply BasicColoring once
4:   sort vertices by colors
5:   for  $\ell = 2^{\lceil \log n \rceil}$  to 3 do
6:     for all vertices  $i$  of color  $\ell$  pardo
7:        $\text{col}(i) \leftarrow \min\{\{0, 1, 2\} \setminus \{\text{col}(P[i]), \text{col}(S[i])\}\}$ 
```

Lemma 9

A ring can be colored with 3 colors in time $\mathcal{O}(\log n)$ and with work $\mathcal{O}(n)$.

work optimal but not too fast
